

Hosted NetBackup Media Server

Compliment your Symantec NetBackup infrastructure with a hosted NetBackup media server from RevNet. With our service you can bring your backup system architecture in to the 21st century by eliminating tape rotations entirely! No more man hours wasted transferring tapes to offsite storage or wasting precious time troubleshooting tape libraries. When you add a RevNet hosted media server, you compliment your overall DR plan by moving your valuable data offsite every day, and because this data is online, your RPOs and RTOs will not suffer due to tape retrieval and cataloging.

Our hosted NetBackup Media Server includes:

- A private hosted media server
- Monthly subscription based Symantec Netbackup software.
- Backend storage replicated between both RevNet Datacenters
- Daily storage snapshots retained 7 days in the rears
- SSAE 16 audited datacenter controls
- No upfront capital costs

Support model:

At RevNet we understand that the more control a customer has over their environment, the more successful they can be! RevNet will provide operating system patching and Symantec software for installs and upgrades. Our customers have shared 'root' access to servers and are welcome to use our support when or if required. All maintenance happens on your timeline, not ours!
